同 ト イ ヨ ト イ ヨ ト

We will consider the singular problem

(1)
$$(t^n u')' + t^n f(t, u) = 0,$$

(2)
$$\lim_{t\to 0+} t^n u'(t) = 0, \quad a_0 u(1) + a_1 u'(1-) = A,$$

where $n \in \mathbb{N}$, $n \ge 2$, $a_0 \in (0, \infty)$, $a_1, A \in [0, \infty)$, and f(t, x) is continuous on $(0, 1] \times (0, \infty)$ and can have a time singularity at t = 0 and a space singularity at x = 0.

伺 ト イ ヨ ト イ ヨ ト

Consider the equation

(3)
$$(t^3u')' + t^3(\frac{1}{8u^2} - \frac{\mu}{u} - \frac{\lambda^2}{2}t^{2\gamma-4}) = 0,$$

where $\mu \geq 0$, $\lambda > 0$, $\gamma > 1$.

Problem (3),(2) arises in the theory of shallow membrane caps and is a special case of problem (1),(2),where

$$f(t,x) = \frac{1}{8x^2} - \frac{\mu}{x} - \frac{\lambda^2}{2}t^{2\gamma-4}$$

Dickey (Quart.Appl.Math. 1989), Johnson (Quart.Appl.Math. 1997), Kannan and O'Regan (J.Inequal.Appl. 2000), Rachůnková, Koch, Pulverer, Weinmüller (JMAA 2007).

Consider the equation

(4)
$$u'' + \frac{3}{t}u' + \frac{q(t)}{u^2} = 0,$$

where q is continuous on [0, 1] and positive on (0, 1). Problem (4),(2) describes a behaviour of symmetric circular membranes and can be easily transformed to a special case of problem (1),(2), where

$$f(t,x)=\frac{q(t)}{x^2}.$$

Agarwal and O'Regan (Dyn.Contin.Discrete Impuls.Syst. 2003).

An infinite interval problem of the form

(5)
$$z'' + \frac{1}{s^3} \left(\frac{\lambda^2}{8s^{\gamma-2}} - \frac{1}{32z^2} + \frac{\mu}{4z} \right) = 0, \quad 1 < s < \infty,$$

$$(6) \qquad z \text{ is bounded for } s \to \infty, \quad b_0 z(1) - b_1 z'(1-) = A,$$

can be transformed to problem (3),(2) by the substitution $s = \frac{1}{t^2}$, z(s) = u(t). Problem (5),(6) arises in the membrane theory and for A > 0 was solved by

Baxley and Robinson (J.Comp.Appl.Math. 1998), Agarwal and O'Regan (Int.J.Non-Lin.Mech. 2004).

Assume that f(t,x) is continuous on $(0,1] \times (0,\infty)$.

Definition

The function f has a time singularity at t = 0 if

$$\int_0^arepsilon |f(t,x)| dt = \infty$$
 for some $x > 0$ and for each $arepsilon \in (0,1).$

The function f has a space singularity at x = 0 if

$$\limsup_{x\to 0+} |f(t,x)| = \infty \quad \text{for} \quad t\in (0,1).$$

Example

From nonlinear PDEs to singular ODEs. Consider the Dirichlet problem

$$\Delta u + g(r, u) = 0$$
 on Ω , $u|_{\Gamma} = 0$,

where Δ is the Laplace operator, Ω is the open unit disk in \mathbb{R}^n centered at the origin, Γ is its boundary and r is the radial distance from the origin. When searching for positive radially symmetric solutions to this problem, we get the singular problem for an ordinary differential equation of the form

$$u'' + \frac{n-1}{t}u' + g(t,u) = 0, \quad u'(0) = 0, \quad u(1) = 0.$$

- Berestycki, Lions and Peletier (Ind.Univ.Math.J. 1981),
- Gidas, Ni and Nirenberg (Adv.Math.Suppl.Studies 1981).

ロト (得) (手) (手)

Example

In certain problems in fluid dynamics and boundary layer theory the generalized Emden-Fowler equation

$$u'' + \psi(t)u^{-\lambda} = 0$$

arises. Here $\lambda > 0$, $\psi \in C(0, 1)$ and $\psi \notin L_1[0, 1]$.

- Callegari and Friedman (J.Math.Anal.Appl. 1968),
- Callegari and Nachman (J.Math.Anal.Appl. 1978),
- Callegari and Nachman (SIAM J.Appl.Math. 1980).

We are interested in positive solutions of problem (1),(2).

Definition

A function u is called a positive solution of problem (1),(2), if:

- $u \in C[0,1] \cap C^2(0,1)$,
- u(t) > 0 for $t \in (0, 1)$,

•
$$(t^n u'(t))' + t^n f(t, u(t)) = 0$$
 for $t \in (0, 1)$,

• $\lim_{t\to 0+} t^n u'(t) = 0$, $a_0 u(1) + a_1 u'(1-) = A$.

- * 同 * * ヨ * * ヨ * - ヨ

Definition

A function σ is called a lower function of problem (1), (2), if:

- $\sigma\in C[0,1]\cap C^2(0,1)$,
- $(t^n(\sigma'(t)))'+t^nf(t,\sigma(t))\geq 0$ for $t\in (0,1)$,
- $\lim_{t\to 0+} t^n \sigma'(t) \ge 0$, $a_0 \sigma(1) + a_1 \sigma'(1-) \le A$.

If all the inequalities are reversed, then σ is called an upper function of problem (1), (2).

Note that $t^n \sigma'(t)$ can be unbounded at the endpoints t = 0, t = 1.

Some monographs using the method of lower and upper functions for regular problems:

- Coster and Habets, Springer 1996, Elsevier 2004,
- Ladde, Lakshmikantham and Vatsala, Pitman 1995,
- Vasiliev and Klokov, Zinatne 1978.

Some monographs which have extended this method on singular problems:

- Kiguradze and Shekhter, Viniti 1987,
- Rachůnková, Staněk and Tvrdý, Elsevier 2006.

- 4 同 6 4 日 6 4 日 6

In the next three theorems we assume that:

• σ_1 and σ_2 are lower and upper functions of problem (1),(2),

•
$$0 < \sigma_1(t) \leq \sigma_2(t)$$
 for $t \in (0,1)$,

• $\exists p < 2$ such that $\lim_{t \to 0+} t^p h(t) < \infty$,

where
$$h(t) = \sup\{|f(t,x)| : \sigma_1(t) \le x \le \sigma_2(t)\}.$$

Note that:

- σ_1 and σ_2 can vanish at t = 0 and t = 1,
- f can have singularities at t = 0 and x = 0,
- therefore *h* can be **unbounded**, i.e.

$$\limsup_{t\to 0+} h(t) = \infty, \quad \limsup_{t\to 1-} h(t) = \infty.$$

・ 同 ト ・ ヨ ト ・ ヨ ト

(1)
$$(t^n u')' + t^n f(t, u) = 0,$$

(2)
$$\lim_{t\to 0+} t^n u'(t) = 0, \quad a_0 u(1) + a_1 u'(1-) = A,$$

Let h be bounded on [0,1]. Then problem (1), (2) has a positive solution u which moreover belongs to $C^1[0,1]$ and satisfies u'(0) = 0 and

(7)
$$\sigma_1(t) \leq u(t) \leq \sigma_2(t)$$
 for $t \in [0,1]$.

Theorem 1 can be proved by the arguments which are used for regular problems.

Let h be bounded at t = 1. Further assume that

 $\limsup_{t\to 0+} h(t) = \infty$

and that there is $\delta_1 \in (0,1)$ such that

(8)
$$(t^n \sigma_1'(t))' \ge 0, \quad (t^n \sigma_2'(t))' \le 0 \quad \text{for } t \in (0, \delta_1).$$

Then problem (1), (2) has a positive solution u which moreover belongs to $C^{1}(0,1]$ and satisfies estimate (7).

-

Let h be bounded at t = 0. Further assume that

$$\limsup_{t\to 1-} h(t) = \infty, \quad \sigma_1(1) = \sigma_2(1)$$

and that there are $\delta_2 \in (0,1)$, $K \in \mathbb{R}$ such that

(9)
$$(t^n \sigma'_1(t))' \ge K$$
, $(t^n \sigma'_2(t))' \le K$ for $t \in (1 - \delta_2, 1)$.

Then A = 0 and problem (1), (2) has a positive solution u which moreover belongs to $C^{1}[0, 1)$ and satisfies estimate (7) and u'(0) = 0.

(日)

-

We use the following approach to prove Theorems 2 and 3:

- the singular problem (1), (2) is approximated by a sequence of solvable regular problems,
- a sequence {*u_n*} of solutions of the regular problems is generated,
- a convergence of a suitable subsequence {u_{k_n}} is investigated and a limit u = lim_{n→∞} u_{k_n} is obtained,
- the type of the convergence determines the properties of *u* and implies that *u* is a solution of the original singular problem (1), (2).

< ロ > < 同 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Constant lower and upper functions

If
$$A > 0$$
 and if there exist $0 < r_1 \le \frac{A}{a_0}$ and $r_2 \ge \frac{A}{a_0}$ such that

(10)
$$f(t,r_1) \ge 0, \quad f(t,r_2) \le 0 \quad \text{for} \ t \in (0,1),$$

then the constant function $\sigma_1(t) \equiv r_1$ is a lower function of problem (1), (2), and the constant function $\sigma_2(t) \equiv r_2$ is an upper function of problem (1), (2).

< 同 > < 回 > < 回 >

We demonstrate the application of Theorems 1-3 on the problem

(11)
$$(t^n u')' + t^n \left(\frac{a}{u^{2m}} - \frac{b}{u^m} - ct^{2\eta}\right) = 0,$$

(2)
$$\lim_{t\to 0+} t^n u'(t) = 0, \quad a_0 u(1) + a_1 u'(1-) = A,$$

where a > 0, $b, c \ge 0$, $\eta > -1$, $m, n \in \mathbb{N}$, $n \ge 2$, $a_0 > 0$, $a_1, A \ge 0$.

We can find lower and upper functions (nonconstant in general) for all values of the parameters.

$$c, 1-t, 1-t^2, t^{-\frac{\eta}{m}}, (1-t^2)^{\frac{1}{2m}}$$

-

For simplicity we show how to find lower and upper functions just for the problem

(11)
$$(t^n u')' + t^n \left(\frac{a}{u^{2m}} - \frac{b}{u^m} - ct^{2\eta}\right) = 0,$$

(12)
$$\lim_{t\to 0+} t^n u'(t) = 0, \quad u(1) = A,$$

where b > 0.

同 ト イヨ ト イヨ ト

I. We assume: A > 0.

$$ax^{2} - bx - c = 0, \quad x_{1} = \frac{b + \sqrt{b^{2} + 4ac}}{2a},$$

$$c_{1} = \min\left\{A, \frac{1}{\sqrt[n]{x_{1}}}\right\}, c_{2} = \max\left\{A, \sqrt[m]{\frac{a}{b}}\right\}, c_{3} = \max\left\{A, \frac{1}{\sqrt[n]{x_{1}}}\right\}.$$

• $\eta \ge 0$: *h* is bounded

$$\sigma_1(t)=c_1,\quad \sigma_2(t)=c_2,\quad t\in [0,1],$$

• $\eta \in (-1, 0)$: *h* is unbounded at t = 0

$$\sigma_1(t) = c_1 t^{-\frac{\eta}{m}}, \quad \sigma_2(t) = c_3, \quad t \in [0, 1].$$

(日) (同) (三) (三)

II. We assume: A = 0.

$$egin{aligned} &ax^2-bx-c=0,\quad x_1=rac{b+\sqrt{b^2+4ac}}{2a},\ &\exists c_1\in\left(0,rac{1}{\sqrt[m]{x_1}}
ight),\quad \exists c_2>\sqrt[m]{rac{a}{b}} \end{aligned}$$

•
$$\eta \ge 0$$
: *h* is unbounded at $t = 1$

$$\sigma_1(t)=c_1(1-t^2), \quad \sigma_2(t)=c_2(1-t^2)^{rac{1}{2m}}, \quad t\in [0,1],$$

• $\eta \in (-1,0)$: *h* is unbounded both at t = 0 and at t = 1

$$\sigma_1(t)=c_1t^{-rac{\eta}{m}}(1-t), \quad \sigma_2(t)=c_2(1-t^2)^{rac{1}{2m}}, \quad t\in [0,1].$$

イロン イロン イヨン イヨン

æ

Similar lower and upper functions can be found for other values of parameters b and a_1 . Then, by Theorems 1–3, we get the following existence result for the problem

(11)
$$(t^n u')' + t^n \left(\frac{a}{u^{2m}} - \frac{b}{u^m} - ct^{2\eta}\right) = 0,$$

(2)
$$\lim_{t\to 0+} t^n u'(t) = 0, \quad a_0 u(1) + a_1 u'(1-) = A,$$

where a > 0, $b, c \ge 0$, $\eta > -1$, $m, n \in \mathbb{N}$, $n \ge 2$, $a_0 > 0$, $a_1, A \ge 0$.

-

Problem (11), (2) has a positive solution u such that

•
$$\eta > -\frac{1}{2} \Longrightarrow u(0) > 0, \ u'(0+) = 0,$$

•
$$\eta = -\frac{1}{2} \Longrightarrow u(0) > 0, \ u'(0+) = \frac{c}{n},$$

•
$$\eta < -rac{1}{2} \Longrightarrow u(0) \geq 0, \ u'(0+) = \infty$$
 ,

and
